

Statistical Institute of Jamaica (STATIN)

Monthly Close Manual — Vacation Accrual Pause Adjustment

Audience: HR / Payroll executives and Time Off administrators
Product: Factorial Time Off
Related policy: Statistical Institute of Jamaica — Vacation Leave Management System Requirements
Language: English (executive)

1. Purpose

This manual explains **what STATIN must do at the end of every month** so vacation balances stay aligned with Jamaica policy, even though Factorial does **not** automatically pause vacation accrual during long absences.

One-sentence summary

Each month-end, identify employees with leave of absence longer than **14 consecutive calendar days**, calculate how much vacation Factorial would still have accrued in that window, and **manually adjust** that amount off their vacation balance.

2. Why this process exists

Jamaica rule (your document)	What Factorial does today
If leave of absence exceeds 14 consecutive calendar days (vacation, sick, maternity, study, compassionate, special, or other approved LOA), vacation does not accrue during that absence	Factorial continues its normal accrual engine. There is no native “pause accrual” switch on leaves
Accrual uses eligible calendar days ÷ 365 (or 366) × annual rate	Accrual is policy-driven (monthly generation, working-day charging, etc.)
Unused leave may accumulate up to 3 years (15→45, 20→60, 21→63, 25→75)	Configured on SIJ Vacation policies / allowances

Honest product note: Factorial covers entitlements, policies, working-day charging, and balances well. The **>14 calendar-day pause** is a **STATIN control process** (report + manual adjustment), not an automatic system behaviour.

3. Terms (plain English)

Term	Meaning
Accrual	Vacation days the employee earns over time
Calendar days	Consecutive days including weekends (used for the 14-day pause rule)

Working days	Monday–Friday; how Factorial usually charges vacation taken
Leave of absence (LOA)	Approved absence types that can trigger the pause (sick, vacation, maternity, etc.)
Gap / manual adjustment	Days Factorial would still accrue during a pause window — HR removes them with an allowance incidence (or equivalent balance correction)
Tenure start / Antiquity	Factorial employee fields for tenure — use them as shown in Factorial; do not reinvent tenure outside the product
SQL Summary report	One row per employee with the total to adjust
SQL Power report	One row per absence (detail / audit)

4. Who does what

Role	Responsibility
Time Off Admin / HR Ops	Run reports, prepare adjustment list, post corrections, archive evidence
HR Manager	Approve the month-end adjustment pack
Payroll / Finance (if needed)	Confirm balances before payroll lock if vacation affects pay
Employee	No action for this control (adjustments are admin-side)

Suggested owner: one named **Month-End Time Off Controller**.

5. When to run (monthly rhythm)

Step	Timing
Close the calendar month	Last working day (or first 2 working days of next month)
Cut-off for absences in scope	All approved leaves that overlap the month
Post adjustments	Same day as report sign-off
Archive	Same day (PDF/Excel + sign-off note)

Recommended cut-off filters for the SQL tools:

- `Data_init` = first day of the month (e.g. 2026-08-01)
- `Data_end` = last day of the month (e.g. 2026-08-31)

6. Month-end checklist (do this every month)

Step 1 — Freeze the period

1. Confirm the month you are closing (e.g. August 2026).
2. Ensure late leave requests for that month are **approved or rejected** before you run reports.
3. Do not include draft / pending leaves in the adjustment pack.

Step 2 — Run the Summary report (HR totals)

1. Open Factorial **Analytics / SQL** (or your saved report).
2. Paste / run: `sqlxemplo_resumo.txt` (Employee summary).
3. Set filters: - **Data_init** = month start
- **Data_end** = month end
4. Export to Excel/CSV.

Focus columns:

Column	Use it for
<code>Pause_Absences_Count</code>	Who had at least one pause case
<code>Sum_C_Total_Manual_Adjustment</code>	Total days to remove from vacation
<code>Sum_C_Rounded_Jamaica_Half_Up</code>	Same total with Jamaica half-up rounding (≥ 0.50 up)
<code>Annual_Entitlement_Days</code>	Confirm employee is on the correct SIJ tier (15 / 20 / 21 / 25)

Rule of thumb: If `Pause_Absences_Count` = 0 → no pause adjustment for that person this month.

Step 3 — Spot-check with the Power report (audit)

1. Run `sqlxemplo_power.txt` with the **same** date filters.
2. For anyone with a material gap, open 1–2 absence rows and confirm: - Calendar days **> 14** - Leave family is an LOA type (sick, vacation, maternity, study, compassionate, special, etc.) - Status is approved
3. Keep the Power export as **audit evidence**.

Step 4 — Prepare the adjustment pack

Create a short table for sign-off:

Employee	Code	Tier (days/yr)	Pause absences	Days to adjust (Sum_C)	Rounded	Notes
Felicity Ford	EM-...	25	1	1.10	1	Sick 3–18 Aug

Attach: - Summary export
- Power export (or filtered rows)
- Month / cut-off dates

Step 5 — Get approval

1. HR Manager reviews and signs (email or signed PDF is enough).
2. Do **not** post adjustments before approval if your internal control requires dual control.

Step 6 — Post corrections in Factorial

For each approved line:

1. Open the employee → **Time Off**.
2. Apply a **manual balance correction** on the **SIJ Vacation** allowance
(Factorial: allowance **incidence** / adjustment — negative days equal to Sum_C or the rounded value your policy adopts).
3. Description example:
Month-end Jamaica pause adjustment — Aug 2026 — LOA >14 calendar days — see SQL summary
4. Save / confirm.

Policy choice (document once and keep stable):

- Use **exact** Sum_C_Total_Manual_Adjustment, **or**
- Use **rounded** Sum_C_Rounded_Jamaica_Half_Up

STATIN should pick one method and apply it consistently.

Step 7 — Verify

1. Re-open 2–3 adjusted employees and confirm vacation balance moved as expected.
2. Optionally re-run Summary: gaps already adjusted will still *appear* in SQL as theoretical gaps unless you track posted adjustments separately — so keep an **Adjustment Log** (Step 8).

Step 8 — Archive

Store in your HR shared drive / DMS:

- YYYY-MM_STATIN_Vacation_Pause_Summary.xlsx
- YYYY-MM_STATIN_Vacation_Pause_Detail.xlsx
- YYYY-MM_Adjustment_Log.xlsx (employee, days adjusted, date posted, approver, Factorial reference)
- Approval email / PDF

Retention: follow STATIN records policy (recommend minimum **3 years**, aligned with leave accumulation horizon).

7. What “good” looks like (acceptance criteria)

At month-end close, all of the following are true:

- ■ All relevant leaves for the month are approved or rejected
- ■ Summary report run for the full calendar month
- ■ Every employee with Pause_Absences_Count > 0 is either adjusted or explicitly waived with reason

- Adjustments posted only to **SIJ Vacation** balances
- Manager approval recorded
- Exports + adjustment log archived

8. Exceptions & edge cases

Situation	What to do
Absence spans two months (e.g. 25 Jul–10 Aug)	Include in both month reports if the leave overlaps; adjust once for the full pause window (prefer adjusting in the month the leave ends , and note “multi-month LOA” in the log to avoid double-counting)
Two overlapping long absences	Prefer Power report to understand windows; adjust the sum of gaps from Summary unless overlaps double-count — if unsure, adjust from Power line items once
Pending leave approved after close	Run a supplemental mini-close or fold into next month with label <code>late approval – prior month</code>
Employee on wrong SIJ tier (15/20/21/25)	Fix policy assignment first, then recalculate gap
Working-from-home absences	Out of scope for pause (excluded in reports)
Recall from vacation	Separate process: credit unused approved days back (manual incidence). Not the same as the >14 pause

9. Roles of the two SQL reports

Report file	Grain	Best for
<code>sqlxemplo_resumo.txt</code>	1 row = 1 employee	Month-end pack, totals to adjust
<code>sqlxemplo_power.txt</code>	1 row = 1 absence	Audit, demo, dispute resolution

You do **not** need both every conversation with leadership — Summary is enough for the monthly pack; Power is the evidence pack.

10. Executive talking points (if asked in a meeting)

“Factorial manages our SIJ vacation tiers, working-day charging, and balances.

Jamaica also requires accrual to **stop** when someone is off more than **14 calendar days**.

That pause is not automatic in Factorial, so every month we run a control report and post a small manual correction.

Summary tells us **who** and **how much**; Power shows **which leave** caused it.”

11. Related configuration (reference only)

Already configured in the STATIN Factorial demo / workspace:

- Leave types: SIJ Vacation, Sick, Maternity, Study, Compassionate, Special
- Vacation policies: **15 / 20 / 21 / 25** days per year with **3-year caps** 45 / 60 / 63 / 75
- Working-day charging; public holidays do not consume vacation balance

These settings support day-to-day Time Off. They **do not** replace this monthly pause control.

12. Document control

Item	Value
Document title	Monthly Close Manual — Vacation Accrual Pause Adjustment
Client	Statistical Institute of Jamaica (STATIN)
Version	1.0
Status	Executive operating procedure
Companion files	sqlxemplo_resumo.txt, sqlxemplo_power.txt, TIMEOFF_SETUP_SUMMARY.md, DEMO_SCRIPT_TIMEOFF.md

13. Quick one-page card (print / pin)

Every month-end

1. Approve/reject all leaves for the month
2. Run **Summary** SQL (Data_init–Data_end = that month)
3. Spot-check big gaps with **Power** SQL
4. Get HR Manager sign-off
5. Post negative vacation adjustments = Sum_C (or rounded)
6. Save exports + adjustment log

Success = no employee with a >14-day LOA still carrying unadjusted vacation accrual for that window.
